

# SUMMER INTERNSHIP

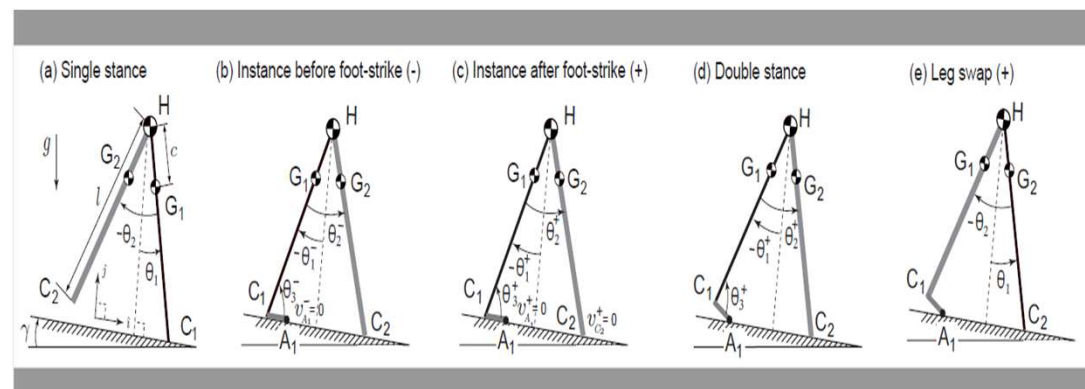

DEPARTMENT: MECHANICAL AND INDUSTRIAL ENGINEERING

SUPERVISOR: DR. PRANAV A. BHOUNSULE

INTERN: NGUYEN HOA PHAM

# Project description

- ▶ Title: Data mining human walking data
- ▶ Conducted research on experimental data collected by Ohio State University
- ▶ Fitted model of person to data to obtain joint torques
- ▶ Objectives: Identify how human balance based on relationship between joint torques and joint angles.

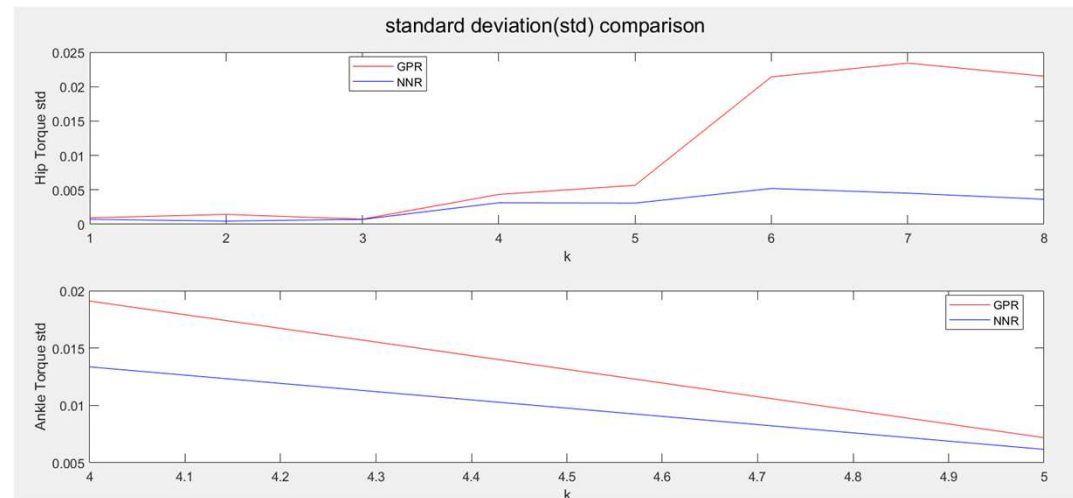

# Responsibilities

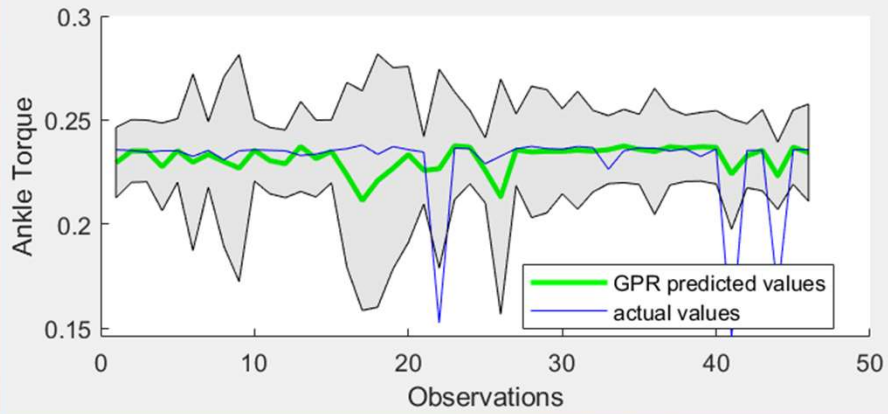

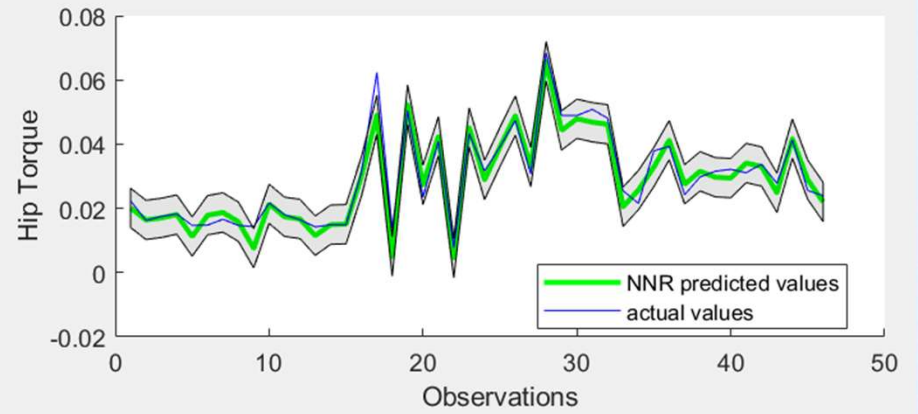

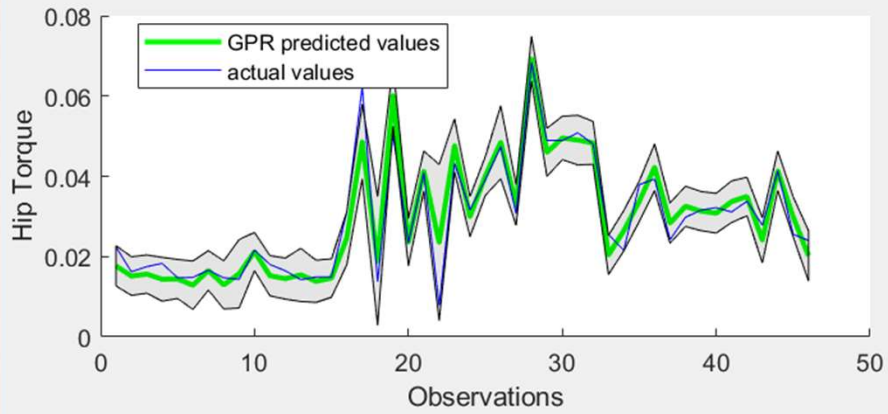

- ▶ Using data mining and regression techniques to figure out how human balance.
  1. Learn regression tools in MatLab
  2. Fit models to data
  3. Visualize the fitting results using figures and plots
  4. Optimize the model using feature selection methods.

# Tools - regression

- ▶ Used functions in matlab to generate the regression models.
- ▶ Gaussian Process regression: fitrgp function
- ▶ Neural network regression: fitrnet function, fitnet function
- ▶ Objective: Fit a controller to predict the torques used in physical model.

### DS section k = 4

# Neural network layer size experiment

- ▶ Objective: determine the hidden layer sizes that give the lowest mean squared error on predictions of fitnet function

The screenshot shows the Neural Network Training (nntraintool) window. At the top, the title bar reads "Neural Network Training (nntraintool)". Below the title bar, the "Neural Network" section displays a diagram of a feedforward neural network with 3 input nodes, 20 hidden nodes, and 2 output nodes. The diagram shows the flow from the input layer through the hidden layer to the output layer, with weights (W) and biases (b) and an activation function symbol.

The "Algorithms" section lists the following settings:

- Data Division: Random (dividerand)
- Training: Levenberg-Marquardt (trainlm)
- Performance: Mean Squared Error (mse)
- Calculations: MEX

The "Progress" section shows the following training metrics:

Epoch:	0	13 iterations	1000
Time:		0:00:00	
Performance:	0.00340	3.28e-06	0.00
Gradient:	0.0186	1.11e-05	1.00e-07
Mu:	0.00100	1.00e-08	1.00e+100
Validation Checks:	0	6	6

The "Plots" section lists the following plot types:

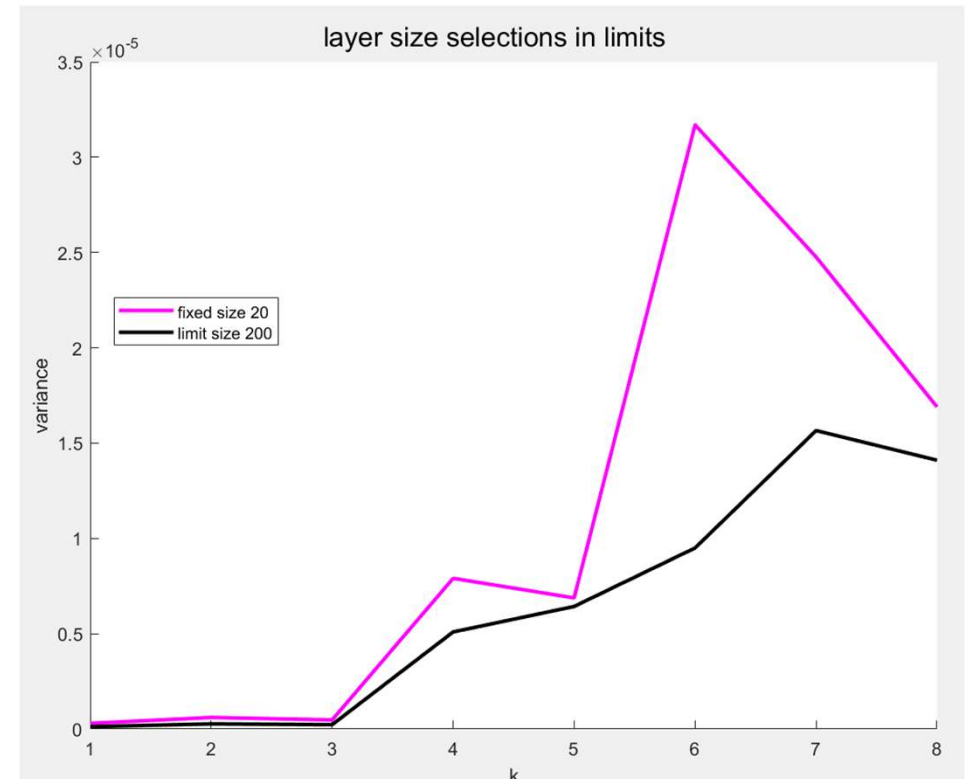

- Performance (plotperform)
- Training State (plottrainstate)
- Error Histogram (ploterrhist)
- Regression (plotregression)
- Fit (plotfit)

The "Plot Interval" is set to 1 epochs.

A green checkmark and the text "Validation stop." are displayed at the bottom of the window. Below this, there are two buttons: "Stop Training" and "Cancel".

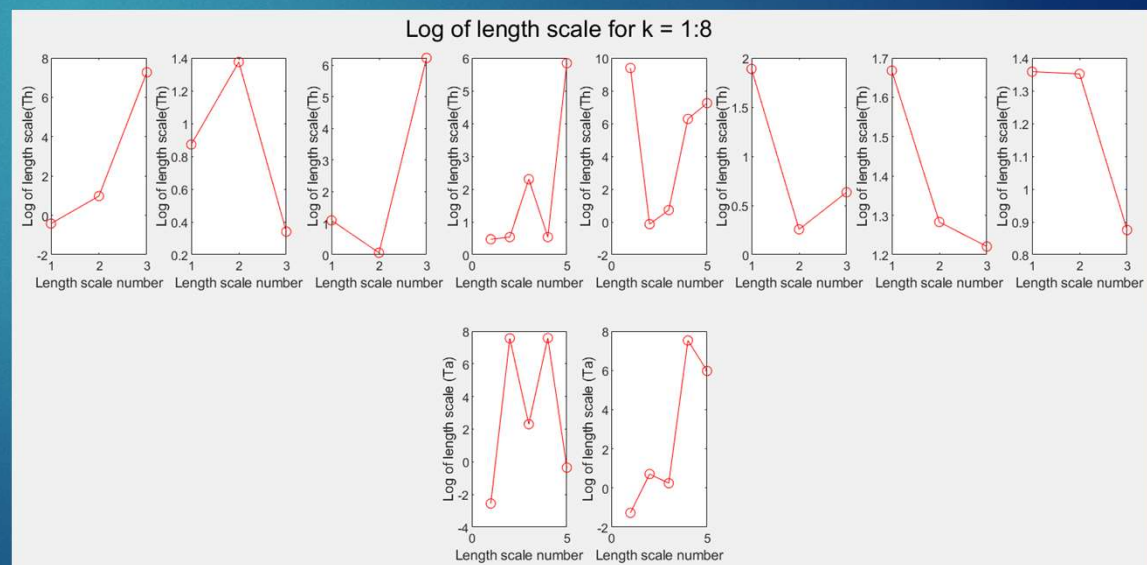

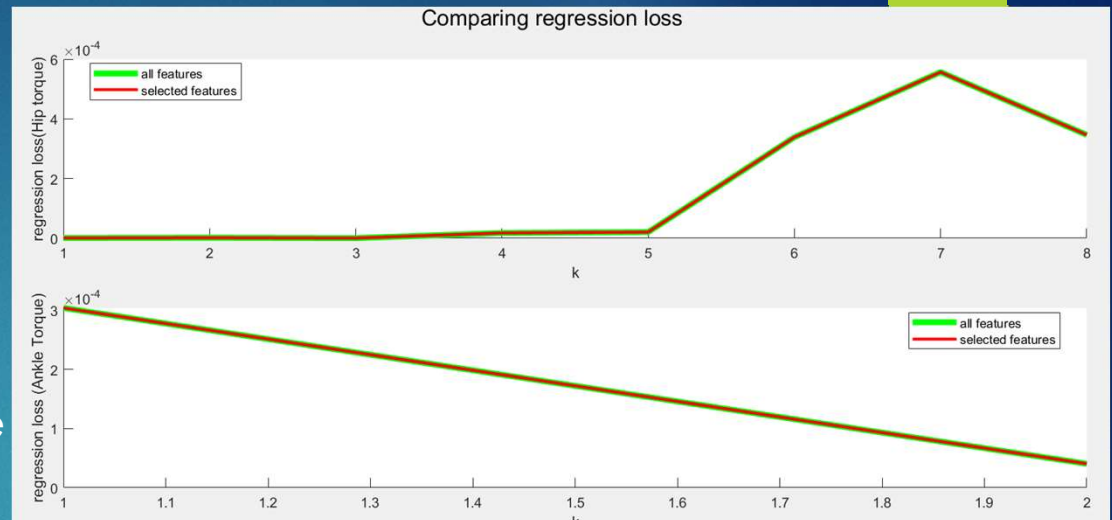

# Neural network layer size experiment

- ▶ Result:
- ▶ Layer sizes = 149, 180, 127, 178, 162, 114, 60, 32 for each section  $k$  respectively
- ▶ The variance of the prediction decreased but not significant
- ▶ The time for training the model increases as the layer sizes increase, but not affect the time to get the predictions from the model

# Tools – feature selection

- ▶ Objective: Identify the importance of the features in predicting the output
- ▶ Tools used: used separate length scale for predictors.

### Log of length scale for k = 1:8

Thank you for listening
